Bacteriophage peptide library;peptide epitope; therapeutic target; variegated compound library; ss. consensus ligand sequence 1 DNA

```
The present invention relates to antisense compounds, compositions and methods for modulating the expression of MRK4 (also referred as mitogen activated protein kinase kinase 4; MAP144; MAP three kinase 1; MAP18K kinase kinase 4; MAP1844; MAP three kinase 1; MAP18K kinase kinase 4; MAP18K4; MCK13, The antisense oligos are useful for inhibiting the expression of MCK4 in cells or tissues. They are also useful for treating an animal having a disease or condition associated vith MRK4 such as immunological, inflammentory, hyperpoliterative disorder or cancer. Sequences of the invention are also useful for disances: therapeutics, prophylaxis and as research resigned and kits. They are also useful in antisense charapy. The present sequence is an antisense oligonucleocide targetted to human MEK4 DNA. This sequence is us useful new exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense compound targeted to nucleic acid encoding mitogen-activated protein kinase 4, useful for treating immunologic disorder, inflammatory disorder or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            16.7%; Score 20; DB 24; Length 20; 106.0%; Pred.                                                                                                                                                                                                                                                                                                The present sequence encodes an exemplary consensus sequence obtained after paning with the D-enaningmer of interleavin-9 (II-8). The sequence was obtained using the method of the invention. The method identifies was obtained using the method of the invention. The method identifies compounds which interact with a target melecule, and compicises contacting a screening molecule with a variegated compound library, where the carged molecule so fails a variegated compound library, where the carged molecule so fails are selected, and the ability of their with the target molecule are selected, and the ability of their carget protein on the method molecule protein of a target protein (a D-target protein) and a variegated compound library, and cargined because for a farget protein (a D-target protein), and a variegated compound library, and charged protein (a D-target protein) and a variegated compound library, and cargined because of identified by compliance of targets such as receptors, animages, but had not proteins or signal transduction cargined an addition to scoring for interaction of targets such as represent in addition to scoring for interaction of targets such as a process. The method as proteins and adversarily as peptides but with the same diversity as a peptides but with the greatly improved pharmacokinetic profiles needed for drug activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human: WEKK4 modulation; mitogen-activated protein kinase kinase 4; WTK1; MAPKK4; MAP Fire kinase 1; MAPCRK4; prophylaxis; immunological; hyperproliferative disorder; cancer; therapy; antisense; inflammatory; phosphorothioate backbone; ss.

disorder or cancer. Sequences of the invention are also useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human MEKK DNA. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; sFV library: single chain monoclonal antibody fusion reagent; transcription regulation: screening; diagnosis: HIV; Hepatitis A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes methods of screening a DNA construct library for a single chain monoclonal antibody fusion reagent capable of bunding a transcriptional associated blomolecule in vivo. The antibodies are useful in treating Hepatitis A and B respiratory synctial virus, HIV, Junin virus, Herpes simplex i and II, rubella, cytomegalovirus, Varicella Zoster virus, Epstehn Barr virus, measles, hanavirus, dengue, Ebola inter alia and cancer. Expression vectors that encode the fusion antibodies may be used in gene therapy. The methods can be used to create and isolate the fusion antibodies. The monoclonal antibody fusion reagent can be used to regulate transcription in vivo. AAX76591 to AAX76674 represent specifically claimed PCR primers used in the construction of a human sfv library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antibodies from libraries useful in treating viral infections and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA26959 to AA27740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and happing of the human genome, and in complex association studies and happing of the human genome, and in complex association studies and happing of the human genome, and in complex association studies and persent of the invention can also be useful for the identification of the targets for the development of pharmaceutical agence and diagnostic methods, as well as the effect of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel biallelic markers used to construct a high density disequilibrium map of the human genome \,\cdot\,

AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA265979 to AA277440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for discess states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of characterisation of the differential efficacious responses to and side characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                               Novel bialielic markers used to construct a high density disequilibrium map of the human genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fibronectin type III; En3; monobody; beta-strand domain; loop region; specific binding partner; SBP; catalysis; LRS; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A neomycin resistance gene-contg. DNA fragment was generated by PCR usinglprimer Exneo (AAO7899) which contains nucleotides 149-177 of the neomycin phosphotransferase gene and sites for EcoRi and Xhol. and primer BglII-linked 3 neomycin (AAO78510) which contains the reverse complement to the neomycin resistance gene nucleotides 922-945 and a BglII site. The PCR fragment was used in the construction of a polygistronic vector PPBM5 for expression of neomycin phosphotransferase; the vector also contained a BiP IRES-containing DNA fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, genome; biallelic marker; high density disequilibrium map;

```
The present invention relates to fibronectin type III (Fn1) molecules comprising a stabilising mutation as compared to a wild type Fn3. Fn3 can be used as a scatical to engineer actificial binding proteins.

Modifications of the Fn3 scaffold that increase its stability are useful in that they allow the increduction of more mutations for better functions, and that these make it possible to use Fn3 based engineered proteins in a wider range of applications. The present sequence is an oligonalized described in the exemplification of the invention.
with the carboxy, terminal amino acids of MMACI (see AAY53754).
Specifically, it appears that domain 7, 10 and 13 interact with MMACI.
Since MMSC2 contains 11 PDZ domains and interacts with NMACI, at known tumour suppressor having a region of homology with protein tyrosine phospatases. WMSC2 acts as a scafeding protein in a common blological pathway with MMACI. It is believed that the interaction between MMACI and MMSC2 is required for the tumour suppressor activity of WMACI. The WMSC2 polypeptides, polynucleotides, fragments and specific or complex specific antibodies may be used for detecting cancer or a predisposition to cancer and screening loss agents that may be used to treat MMSC2 and VMMCI related cancer. The polypeptides and polynucleotides may also be used to treat cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New fibroncetin type III molecule comprising a stabilizing mutation, useful for introducing more metations for better functions, and in a wider range of applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fibronectin type 3: mutant: stabilising mutation; Fn3; antibody; binding protein; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a synthetic fibronectin type III (Fn3)

Croplypeptide monobody that comprises Fn3 beta-strand domain sequences that are linked to loop region sequences (LMSS). One or more of the loop sequences in the synthetic Fn3 vary by deletion, insertion, or replacement of at least 2 amino acids from the corresponding LMSS in vild-type Fn3 wise cells containing an expression vector comprising the cultarype Fn3 unclein acid are used for the production of the Fn3 monobody. The invention also provides methods of identifying the amino cold sequence of a polypeptide molecule (1) capable of binding to a specific binding partner (SMP) so as to form a polypeptide sMP complex; (11) capable of catalysing othemical reaction with a catalysed rate occusion. Knot. and an uncatalysed rate constant, Knot. and an uncatalysed rate constant, Knot. and an uncatalysed rate constant. Such that the ratio of the Knat/Kunca is greater than 10, Sequences AAX05501-18 represent oligos used for constructing a synthetic Fn3 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; NMSC2; NMAC1; PDZ domain; tumour suppressor; tyrosine phosphatase;

                                                                                                                                                                      AAV19879;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                        g
                                                                                                                                                   This sequence represents a primer for the human interferon-gamma R2
(No. 1872) colons. The amplified sequence is used in the chimeric receptor
(A) of the invention, for cellular activation, which comprises an
extracellular domain (ECD) capable of interacting with a
cytokine intracellular domain (ICD) capable of interacting with a
a cytokine intracellular domain (ICD) capable of interacting with a
cytokine intracellular formation in signal transduction, with the
construction of that the cytokine ICD is not naturally associated with the ECD.
The chimeric receptors can be used for reconstitution of cellular
activation to a ligand where some deficiency prevents activation by the
constitue parhway. Vectors containing by encoding (4) can be used to trace
contine parhway. Vectors containing by encoding (4) can be used to trace a disease or disorder characterised by
controphils, basophils and polymorphonuclear leukocytes. The effector
cells can be used to treat a disease or disorder characterised by
controphils, basophils and polymorphonuclear leukocytes. The effector
cells can be used to treat a disease or disorder characterised by
controphils, basophils and polymorphonuclear leukocytes and as califormune disease. The vectors can also be
contained activities or growth factor sensitivities in
responder cells, e.g. to develop an assay system in which cells not
confailly responsive to a given or growth are rendered responsive, and for
celling the activation pathways of unknown cytoplasmic domains.

                                                                                                                                                                                                                                AAV19827;
                                                                                                                                                RESULT 12
```

```
This sequence represents a primer used in the construction of the recombinant DNA (I) of the invention. (I) comprises a sequence (S1) cerombinant DNA (II) of the invention. (I) comprises a sequence (S2) cercoding the interleukin-10 (II-10) receptor (III0R) and a sequence (S2) cercoding CRFB4, both operably linked to expression control sequences. (CC cells containing (I) may be used to identify agonists/antagonist of cells containing an expension, as vaccine adjuvants, for treatment of photosensitivity, inflammation, autoimmune disease and septic shock, while antagonists are potentially useful for Increasing Immune responses against tumours, or inflammation, autoimmune disease and septic shock, while antagonists are potentially useful for Increasing Immune responses against tumours, or vivuses, bacteria and parasites (especially intracellular pathogens) and cor preventing organ rejection. A vector containing (I) is used to adysfunctional IUIDR and is able to bind IL-10 but not to transduce a dysfunctional IUIDR and is able to bind IL-10 but not to transduce a dysfunctional IUIDR and is able to bind IL-10 but not to transduce a dysfunctional IUIDR and is able to bind IL-10 but not to transduce a signal and in calls. Antibodies specially ribozymes), can inhibt contrivity in calls. Antibodies specially ribozymes; cretivity in calls. Antibodies specially representative or fragments of (I) are used as primers or probes to assay CRFB4 specific cretally especially by intravenous injection or directly into a tumour or allograft.
                                                                                                                                                                                                                                                                                                                                                                                    CREB4: interleukin-10; IL-10; IL-10 receptor: allograft rejection: accine; photosensitivity; inflammation: autoimmune disease; PCR primer; septic shock: immune response; organ rejection; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The Invention relates to a set of novel map-related biallelic markers, preferably located on obestyr disorder-associated chromosomal regions on chromosomes 3.10 and 19. The markers are useful for genotyping or estimating the frequency of an allele in a population, for detecting an association between a genotype or haplotype and a phenotype, e.g. disease involving drug responses, obesity or disorders related to obesity, such as hyperuicamis, dispessive pathology, hepalic (unction disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia, insulin disorders, atheromatous disease and cardiox insulficiency. The markers are useful for detecting a statistical correlation between a biallelic marker obesity-associated biallelic marker located on chromosome 10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human: single nucleotide polymorphism; SNP; polymorphism; cytostatic;

A method has been developed for the high efficiency assembling of multiple DNA fragments. The method comprises: (1) providing each fragment with at least one overhang that is: (a) capable of hydrogen conding to a complementary sequence on a second fragment; and (b) at least long, and (i1) mixing the fragment; and (b) at least long, and (i1) mixing the fragments under conditions that will promote joining. Also described are: (1) a DNA fragment with either on overhang of at least 15 bases, or an end portion suitable for conversion to such an overhang, and (2) a DNA construct prepared by the above method. Any8119 to Any88168 are PCR primers used in the method of the invention in examples shown in the present invention; increasing the length of the overhang from 12 bases (prior art) to 15 results in a framatic increase in annealing efficiency and specificity. This allows the ratio of reagents to be reduced from 1:100-300 to about 1:1, and permits multiple fragments (three or more) to simultaneously join congernate than prior art techniques, producing a higher yield in a shorter length of time.
                                                                                                              Assembling DNA fragments - using complementary overhangs longer than 14 bp to obtain high rates of annealing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primer; multiple DNA fragment single step assembly; promoter; regulatory function; simultaneous assembly; genetic engineering; construct; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABLO0010 to ABLO0104 represent human nucleic acid oligonucleotides comprising one or more single nuclectide polymorphisms (SNPs). ABB56531 to ABB56904 represent human peptides encoded by some of the SNP oligonucleotides. The sequences from the present invention can have immunosuppressive, cytostatic, antiniflammatory, neuroprotective and antibodies from the present invention can be used for treating a and antibodies from the present invention can be used for treating a pathology may be autoimmune diseases, inflammation, cancer, diseases of the nervous system, and infection by pathology. The single from a pathology may be autoimmune diseases, inflammation, cancer, diseases of the nervous system, and infection by pathologent curcorganisms. The SNPs are also useful for determining which forms of a characterised polymorphism are present in individuals. The antibodies may be used in the detection, quantitation and/or callular or tissue localisation of a polymorphic protein (e.g., for use in measuring levels of the polymorphic protein within appropriate physiological samples).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                         Isolated human nucleic acids comprising one or more single nucleotide polymorphisms, useful for treating a subject suffering from a pathology, e.g. autoimmune diseases, ascribed to the presence of a sequence polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primer: multiple DNA fragment assembly; complementary overhang; annealing; specific; spontaneous; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3
                      A method has been developed for the simultaheous assembly of two or more double-stranded DNA fragnents, particularly fragnents produced by primer extension reaction and especially by FOR or by restriction cleavage.

ANYS034 to ANYS318 are PCR primers for use in the method of the invention, and which are used in examples in the present invention. The method can be used to join DNA fragments having a regulatory function of e.g. promoters, enhancers, terminators or thosome binding sites) and fragments encoding proteins e.g. enzymes (expecially cultrate synthases, polymetide synthases and succinyl con-synthetide synthases and succinyl con-synthetide synthases. Constructs produced are useful in genetic enginementing to promoter constructs produced are useful in genetic enginement of the promoter. Onstructs produced are useful in genetic enginement of the produce and construct in which the protein is under the control of the produce and construct in which the protein is under the control of the promoter, or new chimeric promoters or protein is mutant fragment which has been subjected to site-directed mutangeness or mutant fragments in a directional manner, since joining occurs in a single con be joined efficiently.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primer: simultaneous ligation; multiple DNA fragment; assembly; primer extension generated double stranded DNA fragment; UDG; uracil DNA glycosylasc; one-step multiple DNA fragment cloning method; dU rosidue; apurinate; ss.

A method has been developed of ligating 2 or more double stranded DNA conditions and pecules produced e.g. by PCR. The method complete produced to mode the part of primers complementary to each end of the DNA molecule where the primers may also be partially complementary to a second and/or third primers may also be partially complementary to a second and/or third contains a decay uracil (dd) residue replacing a decay-thymidiume (dT) residue at least 15 nuclectides from the 5' end of the primer; (11) annealing the primer and extending the DNA fragment by a primer extension reaction; (iii) adding UDG (uracil) DNA glycosylase) to apurinate the du residue, and a second enzyme or compound by a sprimer extension reaction; (iii) adding UDG (uracil) DNA glycosylase) to apurinate the du residue; (10) alsociating the nicked oilgonuclectides continuated du residue; (10) alsociating the nicked oilgonuclectides canneal to a second or third fragment and ligating them to generate a multi-DNA fragment assembly product. ANY88076 to AAV58093 are PCR contains assembly moders, the method allows the simultaneous and directional cioning of the construct.

So more double stranded DNA fragments. The method avoids the time generation of the construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method has been developed for the simultaneous multi-DNA assembly of at least 2 double-stranded DNA fragments produced by primer extension reaction, especially the polymerase chain reaction (PCR), or by

restriction cleavage or a similar method. AAV58169 to AAV58186 are PCR primers for use in the method of the invention, and are used in examples from the present invention. The method enables the clonding and expression of various proteins e.g. citrate synthases; polyketide synthases; or succinyl coarsyntheres. Cloned fragments preferably have at least 2 regulatory sequences, e.g. promoters; enhancers; terminators; ribosóme-binding sites. The method provides an efficient single-step directional assembly of at least 2 DNA fragments into a construct. The expression, in a simple and rapid procedure, and after joining there is no unwanted linker DNA between the joined fragments.
                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method has been developed for the high efficiency assembling of multiple DNA fragments. The method comprises: (4) providing each fragment with at least one overhang that is: (a) capable of hydrogen bonding to a complementary sequence on a second fragment; and (b) at

The sequence was obtained using the method of the invention. The method identifies compounds which interact with a target molecule, and comprises contacting a screening molecule with a variegated compound library, where the screening molecule with a variegated compound library, where the screening molecule with a variegated compound library, where the screening molecule is chiral. Compounds which have a desired interaction with the target molecule are selected, and the ability of their enactioner to interact with the target molecule is tested. Ligands for a target protein can be identified by combining a Drenationer of a target them selecting one or more compounds from the library which have a
least 15 bases long; and (ii) mixing the fragments under conditions that will promote joining. Also described are: (1) a DNA fragment with either an overhang of at least 15 bases, or an end portion suitable for conversion to such an overhang, and (2) a DNA construct prepared by the above method. ANV58119 to AAV58168 are PCR primers used in the method of the loverhang from 12 bases (prior art) to 15 results in a dramatic increase in annealing efficiency and specificity. This allows the ratio of reagents to be reduced from 1:100-300 to about 1:1, and permits multiple fragments (three or more) to simultaneously join efficient than prior art techniques, producing a higher yield in a brother than prior art techniques, producing a higher yield in a borter length of time.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present sequence encodes an exemplary consensus sequence obtained

  of the candidate mixture. The increased affinity nucleic acids are partitioned from the remainder of the candidate mixture and the isolated nucleic acids are amplified to yield a ligand-entiched mixture of nucleic acids. In which the nucleic acid ligands can be identified. The isolated ligands may be used as pharmaceuticals, diagnostic agents and in gene therapy. The ligands may be RNA or DNN molecutes.

desired binding interaction with the D-target protein. The methods can be used for identifying agonists or antagonists of targets such as receptors, enzymes, DNA binding proteins or signal transduction proteins. The methods can provide a structurally selective approach in addition to scoring for interaction of functional groups. They provide a powerful selection method that allows for the production of ligands with the same diversity as peptides but with the greatly improved pharmacokinetic profiles needed for drug activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAQ8982-91 represent nucleic acid ligands to asscribt endothelial growth factor (VECF). These ligands all contain the consensus sequence given in AAQ8992. These ligands were identified using the method of the invention. The method comprises confacting a candidate mixture with the target molecule (i.e. VECF) where the nucleic acids which have an increased affinity to the target relative to the candidate mixture can be partitioned from the remainder

The sequences given in AA093258.342 represent a group of 2'-NH2 RNA ligands to basic fibroblast growth factor (bFF). These sequences ligands to basic fibroblast growth factor (bFF). These sequences represent the fragment in the consensus sequence given in AA093345. These ligands were isolated using systematic evolution of ligands by exponential enrichment (SELEX). The selection was conducted in PBS at 77 deg. C in the presence of heparin which competes with the RNA for binding to bFGF. The starting ligand pools contained 2'-NH2 modified RNA which has improved stability. After twelver rounds of selection, the RNA pools showed a definite departure from randomness, the affinity of the modified RNA pools was improved by 1-2 orders of magnitude. Individual members of the enriched pools were then cloned into pucils and sequences in Distinct families were identified based on overlapping regions of homology (see also AA09328-95). A number of sequences showed no obvious homology to any of the families come sequences showed no obvious homology to any of the families (see also AA09330-22). One family of ligands bound nitrocellulose (see also AA09330-22). These ligands are inhibitors of bFGF and are therefore useful in treating bFGF mediated conditions and in studying the structure and binding of bFGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ligand; basic fibroblast growth factor; bFGF; gene therapy; vascular; atheroscierosis; angloplasty; stability; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                   The present invention relates to antisense compounds, compositions and methods for medualing the expression of MEKK (also referred as mitogen-scrivated protein kinase 4: MAPJKK: MAP three kinase 1: MAPJERK kinase kinase 4: MAPJKK: MAP three kinase 1: MAPJERK kinase kinase 4: MAPKKE in Cells or tissues: They are also useful for treating an animal having a disease or condition associated with MEKK such as immunological, inflammatory, hyperproliferative disorder or cancer. Sequences of the invention are also useful for They are also useful in animal marks and as research reagents and kits. They are also useful in animals they may be research reagents and kits. They are also useful in animals the present sequence is an antisense oligonucleotide targetted to human MEKK DNA. This sequence is use useful in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                          New antisense compound targeted to nucleic acid encoding mitogen-activated protein kinase 4, useful for treating immunologic disorder, inflammatory disorder or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Family 1; family 2; ligand; basic fibroblast growth factor; bFGF; systematic evolution of ligands by exponential enrichment; SELEX; heparin; selection; region of homology; inhibitor; ss.

The invention relates to a human caudal action protein 17.38, the encoding polynuclectide and a method for preparing the polypeptide by DNA recombination techniques. The polypeptide is used in treating diseases such as protein metabolism disorder. The current sequence represents a human caudal action protein 17.38 related primer sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human caudal action protein 17.38 and encoding polynucleotide, useful for treating protein metabolism disorder
                                                                                                                                                                                                                                                         Ruman; caudal action protein 17.38; protein metabolism disorder; PCR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a PCR primer of the invention. The primer is used for amphilitotion of the E. coll vecrotxin (TY) gene. The oligomucleotide is useful for detection of inactivated VT gene by transfer of a foreign DNA fragment. Simple, rapid and specific amplification of VT gene from environmental factors is achieved using the oligomucleotide of the invention.
                                                                                                     The present invention relates to a purified and isolated non-naturally occurring DNA ligands to basic (libroblast growth factor (DEG).

The ligands are useful as part of gene therapy treatments and for diagnosing pathogenesis of vascular diseases including fulfitation and progression of atherosciences, acte coronary syndromes, veln graft disease and restenosis following coronary angioplasty. The ligands have improved stability in vivo
useful as inhibitors of basic fibroblast growth factors and 2'-amino modified RNA ligands, exhibit increased in vivo stability .
                                                                                                                                                                                                                                                                                                                                                                      0; Caps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  An oligonucleotide for amplification of verotoxin - useful in the detection of inactivated verotoxin gene by transfer of a foreign DNA

The invention provides a novel transgenic rat that comprises cells which comprise at least one copy of a lentivital (LV) nucleic acid. The transgenic rats can be used as models (LV) (e.g. HIV infection and development of disease (e.g. AIDS). The LVs also include primate LVs eq. HIV IHHV2, similar immunodeficiency vitus (SIV) from chimpansee (SIVcpz), Sooty mangebey (SIVsmm) African Green Monkey (SIVsmm), formed monkey (SIVsmm), African Green Monkey (SIVsmm), African Green Monkey (SIVsmm), and Macaque (SIVmac), felline LV e.g. immunodeficiency vitus (RIV), vovine LVs, e.g. bovine common and the vitus (RIV), vovine LVS, e.g. bovine Caprine arthritis encephalitis virus (CAEV), and equine LVs e.g. equine finections anemia virus (EIV), The enimals can be used for indentifying agents for treating or preventing a disease or condition associated with LV. The present sequence represents a probe hybridizing to a human CD4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid segment comprising one of the 10 - 100 bp sequences given in the specification (sequences of a polymorphic site), or the complement of the segment and a method of analysing a nucleic acid comprising determining the base occupying the polymorphic site of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
           New transgenic rats containing lentiviral nucleic acid, used for developing products for treating or preventing lentivirus infection, particularly MIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ss; polymorphic site; nucleic acid analysis; diagnosis; monitoring; cancer; inflammation; heart disease: CNS disease.

                                                                                                                                                                                                                                                                                                       This oligonucleotide is one of two probes (see also AAXS8314) used to examine the expression pattern of PRO358 (see AAXS886), a novel human, homologue of Drosophila Toll protein that acts as a pathogen pattern recognition receptor. The probe is based on full-length DNA7151 (see AAXS829). Expression was found in gut-associated lymphoid itssue and developing splenic white pulp in the foetus. Low level expression was seen in the pALS region of normal adult splene. All other tissues were negative. Isolated nucleic acids encoding PRO357 polypeptides, a process for producing PRO358 polypeptides and an antibody which specifically binds to a PRO358 polypeptide are claimed. The antibody is used in a claimed method for the treatment of septic shock.
                                                                                                                                                                                                                                            New human Toll-like receptors that recognize microbial structures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a cloning primer used in an example from the present invention which describes proteins from Streptococcus preperococcus prepared in the present invention which describes proteins from Streptococcus preumoniae proteins can be useful in vaccines for inducing protective antibodies against Streptococcus preumoniae. For treatment or prevention of infection e.g. pneumonia. Oiltis media or meningitis. Probes based on the nucleic acids are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus agenes or their allelic variants. The proteins can be used shill the proteins or mediated immunossasy, especially for diagnosing or monitoring infections. Antibodies which the proteins and for passive immunisation (optionally coupled to coxin). Vaccines are administered, e.g. by injection, orally or through the stand of the present in the present invention are given in AAV27437 to AAV27562 and AAV39870 to AAV39869.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
polymorphic fragment sequences are disclosed in the specification. The information obtained from nucleic acid analysis by the method described is useful in disquosis or monitoring of diseases like cancer. Inframmation, hear disease, CNS diseases, and susceptibility to infection by an encropranism. In addition, the nucleic acid segments are useful in manufacturing medication in the treatment of prophylaxis of diseases, and also the use of the DNA segments as pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Streptococcus pneumonlae; antigen; vaccine; infection; diagnosis; detection; pneumonia; otitis media; meningitis; cloning primer; ss.

The S. pneumonies entigens have antibacterial activity and can be used in vaccines. The S. pneumoniae antigens can also be used to prevent or attendate a Streptococcus infection in an animal. The polynuclectides encoding the S. pneumoniae antigens can be used to detect Streptococcus nucleic acids. AB084905 to AB085130 represent primars used in the cloning of S. pneumoniae ORFS (open reading frames) which are used in an example from the present invention.

```
AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA269579 to AA277440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and differential efficacious responses to and side characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel biallelic markers used to construct a high density disequilibrium map of the human genome {}^{\bullet}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AA2656st to AA269578 represent human biallelic markers from the present luneation, which contain a polymorphic base at position 24 of their nucleotide sequences. AA26959 to AA2740 represent amplification primers for the biallelic markers. The biallelic markers of the primers for the biallelic markers. The biallelic markers of the primers for the biallelic markers and biallelic markers and the used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of characterisation of the differential efficacious responses to and side characterisation of the differential efficacious responses to and side
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel biallelic markers used to construct a high density disequilibrium map of the human genome \dot{z}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               treatment.
N.B. The SEO 1D NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.

PCR primers AAV05465-66 were used to amplify nucleic acids encoding craw. The specification describes a novel method of controlling cell functions controlled by the tumour necrosis factor receptor (TMF-R) pathway containing U1-70. The method comprises introducing a nucleic acid modecule encoding Craw into a cell, and culturing the cell under sultable conditions for transcription and translation of the Craw nucleic acid. Method for preventing and inhibiting apoptosis path, and screening a candidate chemical netlated to the apoptosis path, and screening a candidate chemical netlated to the apoptosis path, and screening a candidate chemical netlated can be used to olderily substances which modulate apoptosis in cells controlled by the TMF-R pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   / Match 13.8%; Score 16.6; DB 19; Length 40; Local Smilarity 64.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Primer CrnA/3'/Xbal (AAT33570), also designated primer B, is complementary to the last 26 nuclectuleds of the CrnA coding region (see also AAT33569) and also includes Xbal and Xhol sites. It was used with primer CrnA/5'/Rl (AAT33569) to amplify the CrnA gene, and with primer Ml (AAT33573) to generate a mutant CrnA gene encoding Till R CrnA protein. CrnA is an inhibitor of tumour necrosis factor and Fas-induced cell death: the point mutation abolishes this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid encoding Yama protein or CrmA mutant - useful for modularing apoptosis, maintaining T cell viability in AIDS patients and for drug screening

The specification describes a novel method of controlling cell functions controlled by the tumour necrosis factor receptor (TNF'R) pathway controlled by the tumour necrosis factor receptor (TNF'R) pathway montaining U1-70. The method comprises introducing a nucleic acid molecule encoding CrmA into a cell, and culturing the cell under suitable conditions for transcription and translation of the CrmA nucleic acid method for preventing and inhibiting apoptosis by inhibiting activation of the U1-70 path, identifying the chemical related to the apoptosis path, and screening a candidate chemical having biological function in the apoptosis path are also described. The methods can be used to identify substances which modulate apoptosis in cells controlled by the TNF-R pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AA27440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     biallelic markers used to construct a high density disequilibrium

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3.10 and 19. The markers are useful for genotyping or association the frequency of an allele in a population, for detecting an association between a genotype or haplotype and a phenotype. e.g. a disease involving drug responses, obesity or disorders related to obesity, such as hyperuricaemia, digestive pathology, hepatic function disorders, cancer, cardiovascular disease, hypertension, hyperilpidemia, insulin disorders, atheromatous disease, hypertension, hyperilpidemia, markers are useful for detecting a statistical correlation between a biallelic marker allele and a phenotype and/or between a biallelic marker phenotype. This sequence represents a human obesity-associated biallelic marker located on chromosome 10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; obešity associated-biallelic marker; chromosome 10; obesity: ds.; drug response; hyperturicaemia; digestive pathology; hypertension; cancer: hepatic function disorder; cardiovascular disease; hyperlipidaemia; insulin disorder; atheromatous disease; cardiac insufficiency.
be useful for the identification of the targets for the grevious pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficatious responses to and side effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                                         Gaps

This method involves the expression of a blotin gene or its functional variants, analogues and derivatives, in a prokaryote or eukaryote that is able to produce biotin. The cells are grown and the biotin produced either used directly, after separation of the blomass, or after purification. Constructs containing this nucleic acid or protein or their variants erc., can be coupled to one or more regulators for increasing agene and/or protein expression, and/or having lits natural regulators switched off. Expression of this biotin protein blotin, thus increasing vield and making possible an industrially useful elementative method for blotin production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

The invention provides bovine herpes virus-2 (BHV-2) based vectors that comprise at least one cytoChire-encoding DNA sequence. The expression of cytoChines in mammals can up-regulate immune responses to the immunogens. The cytoKhine is solected from interleakins (IL), colony stimulating decreases of considerating and tumour necrosis factors (TRF), interfectors (IRN) and tumour necrosis factors (TRF). The BNV-2 based vector or recombinant virus can be used as vectors. They can be used for preventing or treating a mucosal disease in a subject, e.g. rumnants, cattle, sheep, yoats, doys, cats, horses, or man, particularly mastifis in cava or breast cancers in humans. They can also be used for preventing a stress induced disease.
Bovine herpos virus-2; BHV-2; cytokine: immune response; immunogen: IL; interleukin... colony stimulating factor. 78; interfectors; if NN: TNF: timour necrosis factor; recombinant virus: vaccine; mucosal disease; mastilis; breast cancer; stress-induced disease; PCR primer: ss.

   This invention describes a novel electron donor system (MI) that
transfers electrons to an enzyme with redox properties comprising
transfers electrons to an enzyme with redox properties comprising
the electron transfer. The invention also describes (1) transferring (M2)
the electron transfer. The invention also describes (1) transferring (M2)

cygen, to a hydrocatbon containing hydrogen donor molecule, where the
pydrogen donor molecule is in a reaction medium comprising the oxygen
transferring enzyme and (MI) in the presence of oxygen and incubating
the cransferring enzyme and (MI) in the presence of oxygen and incubating
under suitable reaction conditions; (2) the enzymatic production (M3) of
terannally or subterminally hydroxylated (position omega 4)

creminally or subterminally hydroxylated (position omega 4)

creminally or subterminally hydroxylated patch or fatty
cacid derivative in the presence of (M1) and cytochrome P450

monooxygenase: and (11) isolating the hydroxylated fatty acids
becaribed in (2): and (4) selecting (M4) fatty acid monooxygenases

comprising: (1) contacting the analyte with a omega hydroxylatable fatty
cacid or a derivative comprising a terminal chromophore or fluorescent
signal, The Invention is useful for the production of omega hydroxylated
catty acids and the detection of fatty acid monooxygenases. The
signal, The Invention selection donor system of enzymes with
credox properties that is cheaper and more efficient, where the enzyme
comprises cytochrome 450.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                           Novel electron donor system useful for the production of owega-hydroxylated fatty acids comprises an inorganic electron sink and a mediafor which enables the electron transfer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polymorphonuclear leucocyte; tissuc damage; inflammation; platelet; eneutrophilic granulocyte; asthma; bronchitis; Alzheimer's disease; coaquilopathy; thrombotic disease; arterial vasopathy; venous vasopathy; myocardial infarction; se.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Caps

AAZ65654 to AAZ69578 represent human bialielic markers from the present invention. Which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the bialielic markers. The bialielic markers of the invention have a variety of uses; they can be used for high density mapping of the invention favor genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and mericods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents metric methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel biallelic markers used to construct a high density disequilibrium

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a fusion protein, designated Lidamycin, composed of Lida-protein (LDP) and Lida-chromophore (LDC), which acts as an anticancer antiblocit and single-chain antibody. LDP and LDC are joined via non-covalent bonds and can be splitted and recombined. A single-chain antibody scyr can specifically join with ly-type collagense and can suppress its activity and in order to increase the permeability of medicine to capillary tubes and the penetrability to real tumour. DNA recombination and molecular recombination are used to prepare new-type constitutive fusion protein LDM-PV of anticancer targeting medicine Lidamycin and single-chain antibody. Its molecular vegith is about 37Kpa. It has the activity to inhibit ly-type collagenses and strong intrusion resistance kill action to cancer cells. It may be an ideal clinic exemplification of the present invention.

Which is
                             The primers AAV27066 and AAV27067 and the probe AAV27069 were used to identify the B8 kD double-stranded adenosine demannase protein. Which is double-stranded adenosine demonstate protein encoded by the double-stranded adenosine deaminase gene. The other protein being a fragment of 93 kD; both proteins have similar biological activity to the full length protein. Double-stranded adenosine deaminase is specific for double-stranded RNA and is useful for the diagnosis of disorders characterised by inappropriate double-stranded ribonucle: so disorders adenosine deaminase expression. Particularly for diagnosis of certain neurological or CNS disorders, e.g. Altheimer's disease, Hunthington's encephalitis or stroke, or other neurological conditions associated with
                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A new strain of HIV-1 was isolated from a seropositive, asymptomatic woman from Zaire: her serum reacted only moderately with peptides specific for HIV-1, including subgroup 0, and reacted with only one African-type V3 peptide. Peptides derived from V3 loops of the new HIV-1 strain are useful in vaccines and for immunodiagnosis. The present sequence represents an oligonucleotide primer which was used for amplifying DNA coding for the V3 loop of HIV-1 envelope dyscoprotein gp120 from various viral strains. A comparison of different strains allowed the Immunodominant epitope of HIV-1 MAD to be identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human immunodeficiency virus; HIV-1; envelope glycoprotein gpl20; variable loop; Zaire; acquired immune deficiency syndrome; AIDS; vaccine; immunodiagnosis; polymerase chain reaction; PCR; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                    The invention relates to human cytokine signal transfer arrestin IV (B2317), to coDNA encoding it (A97467), and to the recombinant production of human cytokine signal transfer arrestin IV Human cytokine signal transfer arrestin IV is a meaber of the cytokine inducible SH2-containing protein, (IS) family and is a close homologue of SOCS+4 (suppressor of cytokine signalling: Genbank Accession No. AF035947). The gene encoding human cytokine signal transfer arrestin IV is located on chromosome 3P21.3. Sequences A97412-A87473 represent PCR primers used in, an exemplification of the invention to subclone human cytokine signal transfer arrestin IV cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ss; Human; double-stranded adenosine deaminase; neurological disorder; CNS disorder; PCR: primer; amplification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a vector comprising an origin of replication, and a selectable marker gene operably linked to a prometer present in the origin of replication, for salective transposon insertion. The corigin of replication, for salective transposon insertion. The vector is free of sequences which tolerate transposon insertion. Also included is a method of constructing a cloning vector incapable of self-ligation comprising linearising the vector, exonuclease degrading constructing the vector, exonuclease degrading constructing the vector incapable of single-stranded fragments and them allowing the strands to anneal and single-stranded fragments and them allowing the strands to anneal and couble-stranded fragments and them allowing the strands to anneal and couble-stranded fragments and them allowing the strands to anneal and couble-stranded fragments and them allowing the strands to anneal and couple-stranded fragments and them allowing the strands to anneal and couple-stranded fragments and them allowing the strands to anneal and couple-stranded fragments and them allowing the strands to anneal and couple-stranded reagments and them allowing the strands to anneal and couple strands on the section in a transposon containing at least two primers capable of binding to the unique sequences. The insertion is carried out a recipient by only ugation, where the from the donor host cell to the zecipient by conjugation, where the content and the resolvase is confered by the recipient host cell, where the transposon but are provided by the donor host cell and and the resolvase is second transposons as is converted by the recipient host cell, where the transposons is second transposons to the transposons is second to the converted by the recipient host cell, where the transposons is second.

The present sequence represents a cloning primer used in an example from the present invention which describes proteins trom Streptococcus preumonlate. Nucleic acid sequence encoding Streptococcus preumonlates. Nucleic acid sequence encoding Streptococcus preumonlates for inducing protective antibodies against Streptococcus preumonlate. For inducing protective antibodies infection to 9, pneumonlate, for treatment or prevention of a infection to 9, pneumonlate, for treatment or prevention of a infection to 9, pneumonlate, for treatment or prevention of a infection of a prevention of infection of a prevention of a process are used to detect corresponding antipons, to purity the proteins and for passive immunisation (optionally coupled to a prevention and serior passive immunisation (optionally coupled to a corrib, vaccines and for passive immunisation (optionally optionally at 0 old 1000 (especially 10:100) am g/ml per dose.

The cloning primers used in the present invention are given in AAV27437
host cell lacks endonuclease I. recA and carries a selectable resistance gene. Where the transposon is a class II transposon preferably stransposon gammadeita or their derivatives, which is preferably ISIO2. The selectable marker confers resistance in a copy number dependent fashion, and inscrtion is carried out in parallel in several different donor host cells comprising different transposons containing different unique site for primer binding. The present sequence is a PCR primer used to construct the transposon-resistant vectors of the invention, psaw and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0: Caps

The S. pneumoniae antigens have antibacterial activity and can be used in vaccines. The S. pneumoniae antigens can also be used to prevent or attenuete a Streptococcal infection in an animal. The polynucleotides encoding the S. pneumoniae antigens can be used to polynucleotides encoding the S. pneumoniae antigens can be used to primers jused in the cloning of S. pneumoniae ORFS (open reading frames) which are used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Barash SC, Dillon PJ, Dougherty B, Fannon MR;

AMT7070S-T70803 represent the random regions from a degenerate ssDNA library based on the sequence represented by AMT4089. These sequences care all ligands specific for fibrin clots identified using the method of the invention is for identifying nucleic the invention. The method of the invention is for identifying nucleic acid (NA) ligands and NA ligand sequences to a tissue target selected from peripheral blood mononuclear cells (PBMC's) (such as the ligands represented by AMT70617-T70704), and carotid arteries (such as these ligands). The method comprises preparing a candidate mixture of NA sequences, and contacting these preparing a candidate mixture of NA sequences, and contacting these with the tissue, whereby NAs having an increased affinity to the tissue relative to the candidate mixture of the increased affinity to the remainder of the candidate mixture. The increased affinity NAs are then partitioned from the remainder of the candidate mixture, and are amplified to yield a mixture of NAs enriched for NA sequences with a relatively higher affinity and specificity for binding to the tissue, whereby NA ligands of the tissue may be binding to the tissue, whereby NA ligands of the tissue may be allowed by exponential enrichment) method. The NA ligands and epitopes and macromolecules identified using the ligands can be used in diagnostic cancer screening, AIDS monitoring, detection and localisation of thrombi or atherosclerosis diagnosis and therapy.
                                                                                                                                                                                                                                                                                                                        Ligand; peripheral blood mononuclear cell; fibrin clot; carotid artery; systematic evolution of ligands by exponential enrichment method; PBMC; epitope; macromolecule; tissue SELEX method; cancer acreening; therapy; AIDS monitoring; localisation of thrombl; atherosclerosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid ligands used in cancer screening, AIDS monitoring etc. - bind to peripheral blood mononuclear cells, fibrin clots or carotid arteries

The present invention describes a method for coverproducing a protein (i) that has an N-terminal amino acid (as) other than Net. The method comprises introducing into cells DNA (II) encoding (i) and having a first coden other than that for Net: (II) DNA (II) encoding a mutant initiator transfer RNA containing the appropriate (i) and nature of a maint and on an (iii) DNA (IV) encoding Met-tRNA transformylase (V). The cells are then maintained under conditions that allow overproduction of (V) and expression of (II). Also described are (I) produced this way. (I) is initiated by Val. Ile or Phe. The host cell is Escherichia coll. and may also be transformed with DNA (VI) encoding the appropriate conditions that the corresponded by the method is particularly used to produce haemoglobin and somatotropin, or other (I) that are toxic to the producing cells. The combination of mutant initiator than and (II) producing acids. The combination of mutant initiator than and vild type gene, particularly a 5-6 fold increase.
                                                                                                                                                                      ö

The present sequence represents the initiation region of a CAT gene, used in the present invention. The present invention describes a method for coverproducing a protein (1) that has an wiverminal amino acid (as) other coverproducing a protein (1) that has an wiverminal amino acid (as) other than wet. The method complises introducing into calls DNA (II) encoding into calls DNA (III) by (III) and other than that for Wet: (III) DNA (III) cencoding a mutant initiator transfer RNA containing the appropriate anti-codon and (III) DNA (IV) encoding Wet-tRNA transformylase (V). The colls are then maintained under conditions that allow overproduction of (V) and expression of (III). Also described are (I) produced this way.

(I) is initiated by Val, II so the Fire the bost cell is Expenditate and any also be transformed with DNA (VI) encoding the appropriate conditions that also overproduced, particularly used to produce haemoglobin and somalotropin, or other (I) that are toxic to the producing cells. The combination of mutant initiator IRNA and (II) provides more (I) than wild-type initiator IRNA and vild-type gene, particularly a 5-6 told increase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Over-production of protein that does not begin with methionine in cells - that contain DNA encoding the protein, mutant initiator transfer RNA and methiony -tRNA transformylase, particularly for haemoglobin and somatocropin production
                                                                                                                                                                                                                                                                                                                                                         Protein synthesis; in vivo; ValRS gene; E.coli; haemoglobin; somatotropin; CAT gene; initiation region; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 41 BP; 19 A; 8 C; 7 G; 7 U; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    윱
                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents the initiation region of a CAT gene, used to the present invention. The present invention describes a method for overproducing a protein. (I) that has an N-terminal amino acid (as) other than wet. The method comprises introducing into cells DNA (II) encoding to than wet. The method comprises introducing into cells DNA (II) encoding the opporation of anti-codon and (III) MA (IV) encoding the appropriate anti-codon and (III) MA (IV) encoding the appropriate anti-codon and (III) MA (IV) encoding the transformylase (V). The colls are then maintained under conditions that allow overproduction of (I) is initiated by val, ile or phe. The host cell is Escherichia coli aminoacil transformed with DNA (VI) encoding the appropriate and may also be transformed with DNA (VI) encoding the appropriate conditions that is the first amino acid. The method is particularly used to producing cells. The combination of mutant (I) that are toxic to the provides more (I) than wild type gene, particularly a 5-6 fold increase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Probe; cytostatic; virucide; immunomodulator; antiinflammatory; hambanstatic; gene therapy; human; tumour; breast cancer; leukaemia; kinetic ataxia telangiectasia protein; ATM20; haemopathy; HIV infection; ataxia telangiectasia; developmental disorder; immunological disease; inflammation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human kinetic ataxia telangiectasia protein ATM20 and encoded polynucleotide, applicable in diagnosis and treatment of e.g. malignant tumor, hemopathy, HIV infection, immunological diseases and various inflammations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a novel human kinetic ataxia telangiectrasia protein ATM20. ATM20 and its coding sequence are useful in the diagnosis and treatment of malignant tumours, e.g. breat cancer and leukaemia; heemopathy; HIV infection; ataxia telangiectasis; and leukaemia disorders; immunological diseases and various inflammations. The present sequence is a probe, which was used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention describes a method for determining whether a subject is affiltacted with a disorder characterised by the presence of a known nucleir acid. The method comprises: (1) amplifying, in an isolated sample from the subject, the nucleic acid segment that, in an affected individual contains (A). (II) Iterating the amplicons with a catalytic nucleic acid (1) that specifically recognizes and cleaves it stayed sequence present in either the mutated or vialt-type segments, but not in both, and (iii) detecting any cleavage caused by (I). Step to not in both, and (iii) detecting any cleavage caused by (I). Step (II) may be performed concurrently with (i). The method is specifically syndrome and cystic fibrosis. (I) recognises as few as two by to create a cleavage site (contrast at least 4 bp required by marynes used in restriction iragment length polymorphism (RRLP) analysis; such sites or create more frequently than restriction enzyme sites, and mismetched specimens or primers can be used to induce cleavage sites for (I). The method is potentially more fiexible than RFLP and does not require any enzymes or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Catalytic nucleic acid-based diagnostic method; determination; AIDS; mutation; ribozyme; target; cleavage; amplification; PCR primer; probe; cancer; human immune deficiency virus; cystic fibrosis; HIV; ss.
   Also a Mac3 restriction site is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting diseases associated with a known mutation by amplification and cleavage with catalytic mucleic acids, particularly for cencer, human immune deficiency virus and cystic fibrosis.
providing a simple diagnostic test. Also a MacJ restriction site increated by the mutation, providing an alternative enzyme test. Mitochondrial but and be obtd. from blood cells, platelets, hair follicle, muscie, brain, liver, amniocentesis fluid etc. Oligonucleotides can be preped. complementary to both Leber's and normal mtbM sequences that include nucleotide 1178. The probes are designed on the DMA strand appropriate to eliminate promiseuous G-T hybridiation by avoiding the use of G or T in the informative position. See also AAQ35965.70.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid-based diagnostic exemplification oligonucleotide #76.

                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                               Human kinetic ataxia telangiectasia protein ATM20 and encoded polynucleotide, applicable in diagnosis and treatment of e.g. malignant tumor, hemopathy, HIV infection, immunological diseases and various inflammations
                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a novel human kinetic ataxia telandiectash protein ATMO. ATMOS and its coding sequence are useful in the diagnosis and treatment of malignant tumours, e.g. breast cancer and leukamis; heemopathy; HIV infection; ataxia telandiectasia; developmental disorders, immunological diseases and various inflammations. The present sequence is a probe, which was used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The probe may be used in a method for detection of neuromuscular diseases associated with a point mutation at mitochondrial DNA position 1178, partic. Leber's hereditary optic neuropathy (LHON). The point mutation changes G to A at position 11778, and converts the 340th amino acid of NADM dehydrogenase subunit 4 from Arg to His, thus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps

The invention relates to a novel truncated vector, 2 kb in length, compressing a truncated VL30 retrotransposon genome, a 5' and 3' long terminal repeat (LTR) sequence from a VL30 retrotransposon, a VL30 retrotransposon primers AL31058-291071 were used to generate the new truncated vector. Intervector into the genome of a recipient cell. The primers AAL31058-291071 were used to generate the new truncated vector. Sequences, and therefore have many useful applications in gene thereby and transposon; e.g. the vector can be used for delivering and expressing a toxin gene to a recipient cell and for in vivo recombinant protein production in mammary cells.
                                                                                                                                          Truncated VL30 retrotransposon genome; long terminal repeat; LTR; PCR primer; polypurine tract; genome integration; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transformed cell; gene Lherapy; gene transfer; gene amplification; gene expression; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New truncated vector useful in gene therapy and transgenic applications, comprises a reduced VL30 retrotransposon genome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yeast aspartic protease 3 (YAP 3) gene-deficient novel yeast strains and process for producing recombinant human parathyroid - hormone using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to movel yeast strains that lack the yeast appartic protease 3 (XA23) gene which can be used for the recombinant production of human parathyroid horamone (HPTH). The invention also encompasses the process for the recombinant production of hPTH in such yeast strains. Sequences ABA96816-ABA96627 represent oligonucleotides which were annealed and ligated together to produce a polynucleotide expressed in a YAP3-deficient yeast strain of the invention.

This invention describes novel ceramide combining peptides. Such peptides are useful as a tool for elucidating the molecular mechanism of cell signal transfer and various cell functions and life phenomena accompanied
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AMT0418 and AAT04419 are DNA molecules complementary to certain areas of human papillomavirus (HPV) 16 K and ET regions. They are used in the construction of HPV-16 E6 and ET ribosymes. AAT0418 incorporates a hammerhead thosyme motif targeting the "Uto" almost adjacent to the E6 translational start site corresp. to nucleotides 108-110 of HPV-16 genomic DNA. HPVs are strongly implicated as important cofactors in development of many human cancers, in partic, anogenital carcinomas. The tibosymes are designed to cleave HPV-16 E6 or E7 ORK transcripts in proximity to translational start sites. The ribosymes cleave mRNA electional start sites. The ribosymes cleave mRNA election of E7 on E7 or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human papillomavirus 16; HPV 16; E6; E7; ribozyme; cleavage; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The patent discloses a method of transferring a DNA sequence to a cell in vitro. The method involves introducing a DNA transfer vector into the cell in vitro to yield a transformed cell, which produces a recombinant virus that comprises RNA transcribed from the DNA vector. The method employs synthetic vectors that are truncated so as to reduce or altogether eliminate homologous recombination with retroviral helper sequences found in helper cells used to propagate the vectors, making them safer for use in humans and providing more convector, making them safer for use in humans and providing more the vectors, making them safer for use in humans and particularly useful cor a variety of applications where it is important to use materials allowing the efficient and faithful transmission of large genes for expression at significant levels. The present DNA sequence is a PCR primer, NS which is used in gene amplification reactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Transferring a DNA sequence to a cell in vitro, useful in gene therapy ofor transmission of large genes, comprises introducing a transfer vector to yield a transformed cell that produces a virus having RNA transcribed from the DNA vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ouery Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on estimating the frequency of an allele in a population, for detecting an association between a genotype or haplotype and a phenotype, e.g. a disease involving drug responses, obesity or disorders related to obesity, such as hyperuricaemia, digestive pathology, hepatic function disorders, accer, candiovascular disease, hypertension, hyperlipidaemia, insulin disorders, atheromatous disease and cardiac insufficiency. The markers are useful for detecting a statistical correlation between a biallelic marker this sequence represents a human obesity, associated biallelic marker located on chromosome 10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ruman; obesity associated-biallelic marker; chromosome 10; obesity; ds; drug response; hypertenaistric digestive pathology; hypertenaisin; cancer; hepatic function disorder; cardiovascular disease; hyperlipidaemia; insulin disorder; atheromatcus disease; cardiac insufficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Truett M:

```
The present sequence is a probe for the human Factor VIIIC 67/70kd doubbit, which can be obtained by thrombin digestion of the 77/80kd fragments of the protein. The probe was created using the partial N-terminal sequence of the two fragments. Factor VIIIC is a plasma protein involved in blood coagulation, and is absent or defective in hemophilia A. The Pactor VIIIC protein can, therefore, be used to treat hemophilia A. The Pactor VIIIC protein can, therefore, be used to treat hemophopilia, as well as in the production of monoclonal antibodies VIIIC subunits in physiological fluids, for example blood or serum.

These ligands all accordant the consensus sequence given in AA088952. These ligands were identified using the method of the invention. The method comprises contacting a candidate mixture on the invention. The method comprises where the nucleic acids which have an increased affinity to the target relative to the candidate mixture can be partitioned from the remainder of the candidate mixture. The increased affinity nucleic acids are partitioned from the remainder of the candidate mixture of the candidate mixture of nucleic acids are applified to yield a ligand-enriched mixture of nucleic acids are much in which the nucleic acid ligands may be used as pharmaceuticals, diagnostic agents and in gene therapy. The ligands may be RNA or DNA molecules.

The invention relates to cornecdesmosin protein (1) and nucleic acid (11) encoding the cornecdesmosin gence, where the gene comparises a base substitution, deletion or linsertion at one or more positions. (1) and custification to the control of the cornecdesmosin procedesmosin useful for screening for agents for use in prognosis, diagnosis and treatment of individuals having or being susceptible to cornecdesmosin mediated disease, by monitoring the reaction between the molecules and the agents. The nucleculed and animo acid polymorphisms are useful for diagnosing or determining susceptible to cornecdesmosin.

The useful in diagnosing or determining susceptible to cornecdesmosin.

The useful in diagnosing or determining susceptible to cornecdesmosin.

The useful in diagnosing or determining particular psoriasis. Fragments of (1) are useful in diagnosit, prognosit or therapeutic methods and as research tools for e.g. in drug screening. (11) is useful as probes or primers for detecting an allele of the polymorphism or in the regulation of cornecdesmosin appears. Antibodies which binds to (1) are useful for screening DNA clone libraries for cells secreting the antipen. (11) is useful as an model to investigate the role of cornecdesmosin in normal skin function. Addisology and present cornecdesmosin coding the structure of the addisornal coding structure and prognosing the structure and por primers of the sequences, single nucleotide polymorphisms (SNPS) and PCR primers of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphism: biallelic: paternity testing; forensic: genetic mapping:
phenotypic typing: medicament; disease: marker; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Corneodesmosin protein and polynucleotide encoding it, having one or more polymorphisms useful in treating, diagnosing or determining susceptibility to corneodesmosin mediated diseases, for e.g. inflammory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    q
                                                                                                                                                                                                                                                                                                                            Sequences AAX06101-X06558 represent human DNA fragments which contain to biallelle polymorphic markers. The base occupying the polymorphic site is indicated by the appropriate IDPAC-IUB ambiguity code. These reagancies can be used in a method for determinant polymorphic forms in midvidual. The invention further provides computer-readable storage medium for storing data for access by an application programme being executed on a data processing system. Such a method comprises a data structure stored in the computer-readable storage medium, the data structure including information resident in a database used by the application programme and including records, each record comprising information identifying a polymorphic solve in the above sequences. The products and methods can be used for analysing polymorphic sites in individuals for testing or genetic mapping of phenotypic traits. They can also be used for the production of polymorphic raits. They can also be used for the production of polymorphic animals. The nucleic access and seems and for the production of transgenic animals. The nucleic access and seems and second in the manufacture of medicaments for the access of the producture of medicaments for the access of the producture of medicaments for the producture of producture of the producture of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to delivery of an agent which can be therapeutic or prophylactic. The method involves administering a composition comprising an attendated gram-negative bacterium (ABB) containing a bacteriophage genome which has been modified to encode for a gene product of interest under control of a eukaryotic promoter or as a fusion protein with a bacteriophage capsid protein. The method is useful for delivering an agent to a subject, for inhibiting solid tumour growth or reducing tumour volume, in breast, prostate, cervical, uterine, lung, ovarian, testicular, thyroid, renal, bladder, pancreatic, stomach, liver or colon cancers and in astrocytome, gliome, mesothellome, and melanome. The present sequence represents a primer used for generating a OmpA-8L-interleukin (IL)-2 gene fusion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAV56530-V56636 are primers used in the amplification of novel feline syttokine proteins. FLAPP40 and FLAPP35. This protein can be used in the production of a FLAPP35/FLAPP40 heterodimor which can potentiate the cytotoxic activity of feline cytotoxic T lymphocyte cells. Such proteins
Delivering a therapeutic agent to a subject for treating tumors, by adminiscering an attenuated bacterial vector comprising a bacteriophage encoding a gene of interest
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytokine; feline; FLAPp40: FLAPp35; heterodimer; cytotoxic; treatment; T lymphocyte cell; autoimmune disease; primer; ss.

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amplases, amploid proteins, andiopoletin, apploasis related proteins, cadherin, cyclin, polymerase, oncogenes, latones, colony stimulating actors, complement related to fistones, kinases, colony stimulating actors, complement related proteins cycochicomes, kinases, sytochicomes, kinases, thosesins, cytochicomes, kinases, proteins cytochicomes, kinases, and thiosenserases the present sequence is cone such oligonuclocided the prevention, diagnosts and the peptides encoded by them may be used in the prevention, diagnosts and the proteins ilsted above. Disorders that may be prevented, diagnosed and/or treated include chown in the prevention of the proteins as autoimmuse diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, consensor, intiammation, cencer (e.g. cancers of the bladder, healn, breast, colon and kidney, concer characters), diseases of the nervous system and an infection of pathogenic
amyloid protein: angiopoletin; apoptosis related protein; cadherin; cyclin; polymerase, oncogene histoner kinasa; colony stimulating factor; complement related protein; cycorhrome; kinesin; cytokine; interferon; interferon; interferon; interferon; multifactorial disease; autoimmune disease; inflammation; multifactorial disease; sutoimmune disease; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunosuppressive: immunostimulatory; antiinflammatory; cytostatic; neuroprotective; antimicrobial; gene therapy; vaccine; amylase; cancer; amyloid protein; anyloidetiu; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating factor; complement related protein; cycohrome; kinase; colony stimulating factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunosuppressive: immunostimulatory; antlinflammatory; cytostatic; neuroprotective; antimicrobial: gene therapy; vaccine; amylase; cancer;
are used for treatment of feline autoimmune diseases e.g. as caused by feline herpes virus or feline calcivirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Probe 643 hybridises to FRNA of Salmonella, but not to E.coli or or other Enterobacter strains. Used to detect Salmonella in food and clinical samplea. TRNA is abundant in cells and appears not to be laterally transferred between contemporary organisms.
                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angloodetin, apoptosis related proteins, calted to amylases, amyloid proteins, angloodetin, apoptosis related proteins, calted proteins, and proteins, and proteins, and proteins, and proteins, and proteins, interferons, interleavings, cytokines, cytokines, interferons, interleavings, cytokines, constant and thioesterases. The present sequence is one such oligonucleotide. The oligonucleotides and the perties encoded by them may be used in the prevention, disponsis and treatment of disposes associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, disponsed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus extythromatosus and Grave's diseases, inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, contains and contains and an infection of pathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, anglopoletin, apoptosis related proteins, cadherin, cyclin, polymerase, anglopoletin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interlewishins, cone such oligonucleotide. The oligonucleotides and treatment of by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed babve. Disorders that may be prevented, dispansed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatchus and Grave's diseases, inflammation, cancer (e.g. cancers of the bladder, breast, colon and kidney, concerned the protein of pathogenic contents).
                                                                                                                                                                                                                Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AX731060 to AA179867 represent isolated human polymorphic polynucleotide sequences (1), which contain single nucleotide polymorphisms (SNPS).

AAM53114 to AAM53129 represent peptides related to human polymorphic polymorphic and in varcine production (1) and the polymorphic polymorphic polymorphic production. (1) and the polymorphic production (2) and the polymorphic production (1) and the polymorphic polymorphic production (2) and the polymorphic applies in samples.

A milbodies may also be used as diagnostic expression and activity. The antibodies may also be used as diagnostic appression and activity. The antibodies may also be used as diagnostic appression and activity. The antibodies may also be used as diagnostic appears for detecting the presence of polymorphic polymorphic applic appears for detecting the presence of polymorphic polymorphic application of an samples.

This sequence represents a PCR primer used in the construction of a cade-fusion polypeptide.

The invention relates to cade-fusion polypeptide nucleic acid constructs, which are used to transform cells to produce systems for identifying compounds which modulate interactions between protein sequences. The cade-fusion polypeptides comprise a periplasmic domain, a transmembrane domain and a Cade transcriptional regulatory domain. Cells transformed with nucleic acid encoding the fusion protein and a cadeA reporter construct can be used for identifying compounds which modulate a specific protein interaction such as modulation of interactions between protein reprotein theraction such as modulation of interactions between protein receptors involved in receptor interactions; e.g. dimerisation. Such methods can be used for identifying ligands for orphan receptors.
                                                                                                                                                                                                                                                                    Tag is applied to DNA to be sequenced and after random fragmentation, DNA will have tag sequence on one end and identifiable (Maxam and Gilbert or Sanger) bases at the other, allowing sequencing. The significantly increases the speed at which the sequencing can be performed. (Updated on 03-0CT-2002 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CadC; fusion protein; erythropoletin receptor dimerisation domain; protein-protein interaction; periplasmic domain; transmembrane domain; CadC transcriptional regulatory domain; receptor interaction; ligand identification; orphan receptor; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel substantially purified sociase transamidase (1) from a Gram-positive bacterium, catalyzing a covalent cross-linking of the carboxyl terminus of a protein having a sorting signal comprising of the carboxyl terminus of a protein having a sorting signal comprising a LPX.3X_4G motif where sorting involves cleavage between the fourth and fifth residues of the motif. The products of the invention have antibacterial activity and can be used in a vaccine. The enzyme is useful in the treatment and detection of Gram positive bacterial infections, especially immunocompromized patterts having Mycobacterium infections. (1) is useful for screening for expression of a cloned polypeptide. The transformed host colls are useful for the production of substantially purified sortase-transamidase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
The system is extremely sensitive in that background is low and the magnitude of signal background is quite robust, such that even minor modulations in protein-protein interactions are readily detectable.
                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                           This sequence represents a P32 labelled probe which was used in the isolation of the chloramphenical acetyl transferase (CAT) gene. The isolated sequence was cloned into a plasmid. e.g. pLXSn-cat containing the CAT gene in a murine leukaemia vitus backbone, and used to test the method of the invention. The method comprises incubating retroviral vectors with deoxyribonuclectide triphosphates before transduction to improve transduction efficiency. Incubation with deoxyribonucleotide triphosphates allows the vector to complete reverse transcription of the RNA genome, producing double stranded meteroduplex viruses which have higher infectivity, and are therefore more effective vectors. The need for virion envelope permeabilisation and preparation of very high titre virus stock is eliminated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymorphic marker; allele-specific; primer; probe; amplification;

Oligonucleotides AAX$2216.532 represent PCR primers and probes used to isolate and amplify cobh encoding secreted and transmenbrane human proteins (see AAX$2213.74 and AAX13344-403). The CDKA sequences are obtained from CDKA libraries, prepared from feetal lung. detail user and fetal intentions, feetal brain, fetal luver and fetal retina. The encoded polypeptides have specific uses based on their homology to known polypeptides, e.g. PRO211 and PRO217 can be used for disorders associated with the preservation and mointenance of gastrointestinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated human genes and polypeptides used in, e.g. treatment of gastrointestinal ulceration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chen J.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This DNA sequence is a region of a Zea mays genome which contains a polymorphic marker. This sequence can be used in the construction of allele-specific primers and probes for amplification or hybridisation e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant. Or trace the progeny of proprietary plants, in certification of a phybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          / Match 13.2%; Score 15.8; DB 19; Length 41; Local Similarity 89.5%; Pred. The present sequence is an oligonucleotide used in the isolation of one of sixty one nucleic acids encoding novel secreted and transmembrane PRO polypeptides are useful for treating skin diseases (e.g. partials); cancers (e.g. lung squamous cell carcinoma); gastrointestinal disorders (e.g. lung squamous cell carcinoma); diseases (e.g. Alzhehmer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. eneconary ischaemia atherosclerosis), inflammatory disorders (e.g. asthma. rhebmarcol arthritis, multiple sclerosis), inflammatory disorders (e.g. and diabetes and retinal disorders such as retinitis pigmentosum. The PRO nucleic acids have applications in molecular biology, including use as hybridization probes, and in chromosome and
                                                                   Sixty one nucleic acids encoding PRO polypeptides which are useful in the treatment of skin diseases (e.g. psorlasis), cancers (e.g. lung squamous cell carcinoma) and neurodegenerative diseases (e.g. hizhelmer's disease)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human: ss; PRO; antiinflammatory; ophthalmological; vasotropic; retinal cell injury; ocular disease; retinitis pigmentosa; probe; macular degeneration; retinal detachment; retinal tear; retinopathy; retinal degenerative disease; macular hole; degenerative myopia; acute retinal necrosis syndrome; traumatic chorioretinopathy; Purtscher's retinopathy; ocdema; ischaemic condition; retinal vision occlusion; collagen vacular disease; thrombocytopaenic purpura; uvellis; retinal vasculitis; Eales disease; systemic lupus exythematosus; environmental trauma.
